SUSTAINABLE CONCEPTS

Sustainability | Our selection of green materials, sustainable tube, glass and dispensing concepts show that the options for sustainable packaging are becoming more abundant.

MonoSol’s water-soluble film is used to make unit-dose pods of shaving cream that dissolve with water. Created with Pacific Shaving Company, this packaging evolution replaces bulky cans and tubes and leaves no waste. The compact Shaving Cream Minis are easy-to-use at home, at the gym or when traveling. The dissolvable pods were developed with a proprietary blend of food-grade ingredients. They are transparent, odour- and tasteless. One challenge in the development was maintaining the integrity of the pod’s film throughout the entire supply chain – from production to the consumer’s hand. The film must then dissolve as quickly as possible when it contacts water.

Sulapac, see page 43, is a very sustainable patented packaging material, made of renewable natural wood chips from sustainably managed forests and other biodegradable biomaterials. In spite of its plastic-like properties it contains no plastic. The Niki Newd’s Soap Case is made from sustainable Sulapac material. The premium eco-packaging soap case was developed to support the Niki Newd brand image as an eco-luxury brand.
Neopac’s sustainable tube made from German spruce wood

M&H Plastic uses sugarcane as a raw material for Bulldog’s updated flexible tube line

Sustainable tubes
Neopac’s Picea is a recyclable sustainable wooden tube. Now there is even more renewable material in the tube body and shoulder. The spruce wood comes from Germany and the food grade tube surface is easy to print.

As the HDPE for Linhardt’s PCR tubes is produced exclusively out of recycled milk bottles, the quality is constant. While processing, a small amount of LLDPE is added. This makes the recycled material more pliable and ensures perfect packaging. The naturally cream-coloured Chalk Tube, which is made of a chalk and plastic compound, has an extraordinary feel and is suitable for natural cosmetics.

Bulldog’s new line of skin care packaging, realised by RPC M&H Plastics and with a sustainable twist, uses sugarcane as a raw material for their updated flexible tube line-up. The green polyethylene is created by farming sugarcane on sustainable land in Brazil, thousands of kilometres from the Amazon rainforest. Once grown, the sugarcane is transformed into ethanol, a type of alcohol, which is in turn used by Broskem to create green plastic. The green plastic maintains the performance characteristics of traditional polyethylene.

Lightweight glass
Verescence’s lightweight jar combines luxury with eco-design that minimises environmental impact while keeping the same capacity.

**SUSTAINABLE BEAUTY AWARDS: PACKAGING**

From over 100 entries for Ecovia’s Sustainable Beauty Awards, which recognise organisations pushing the boundaries of sustainability in the beauty industry, a winner and runner-up were selected for each award category. In the Green Packaging category the winner is Sulapac with its packaging made from renewable wood chips taken from sustainable managed forests, as well as other biodegradable materials. Hair O’Right was the runner-up with its novel packaging for its hair care range. The plastic bottles, whose carbon footprint is about 75% lower than that of conventional bottles, is made from packaging waste. Finalists in this award category were Bio-lage RAW of L’Oréal and O-PAC Eco-Pac.
and the same resistance as a conventional glass. Combined with Neo Infinite Glass, it is one of the most eco-friendly jars on the market. On average, its glass weight is 40% less for a 50ml jar. It is composed of 90% recycled glass and is 100% recyclable.

Melodie Pirouette by Silgan Dispensing Systems, with its threaded fer-rule pump for luxury fragrances, is a refillable, recyclable and sustainable fragrance packaging. The pump can be separated from the glass bottle allowing to recycle the glass. The new design also makes it re-usable as it can be refilled.

The light-weight Epure jars are Group Pochet’s eco-conceived solution for skin care. The range offers a square or a round jar manufactured by Pochet du Courval. The cap of the jar, realized by Qualipac, is made of bio-sourced material or of aluminium. This travel-friendly and minimalist jar has about half the weight of a classic jar, and its environmental footprint is reduced by more than 60%.

Sustainable dispensing
According to Quadpack, sustainable packaging is no longer limited to markets. It is being embraced by premium natural brands like Cristallerie des Parfums, as well as mass natural brands such as the highly-successful 100bon.

Refill concepts are also gaining ground. New, jumbo formats of around 200ml are being proposed as refills by fragrance houses across Europe. Bigger means not only more affordable, but also less packaging. Replacing crimp necks with screw necks allows the bottle to be detached by the consumer. Small, portable fragrance formats can also be refillable, perhaps from the original jumbo pack. The company is working on a new nomad purse spray designed precisely for this purpose, with a screw neck, small capacity and a fun shape to engage the consumer.

Melodie Pirouette by Silgan Dispensing Systems, with its threaded fer-rule pump for luxury fragrances, is a refillable, recyclable and sustainable fragrance packaging. The pump can be separated from the glass bottle allowing to recycle the glass. The new design also makes it re-usable as it can be refilled.

RPC’s Ecosolution is the combination of an AirFree bottle and an exclusive 4-part airless pump made of 100% plastic: The pump and the bottle are 100% polyolefin and therefore 100% recyclable. It does not contain any metal or glass parts, nor any non-recyclable plastics. The external layer of the AirFree bottle can be manufactured in recycled PE, while the internal pouch layer in contact with the formula is made of virgin PE. The internal pouch contains EVOH, a barrier to oxygen, a feature which makes Eco-solution a completely closed and hermetic system. The Slidissime Quartz version is the first ecological airless jar, Ecocert approved. It allows the enclosed formula to be protected from finger contamination and easily dispensed using the elegant airless tactile pump in a jar. The finger slides across the ridge to hygienically dispense an accurate and consistent dose of product that is instantly ready to apply.
